<u>Charles J. Veyas</u>		314

A. PURPOSE.

This module specifies the variable data format of the radio metric data from the Deep Space Network as of 1 January 1978. (Exact effective date will be dependent on available resources.) The content and format of each radio metric high speed data (HSD) block generated and transmitted by the Metric Data Assembly (MDA) are herein detailed.

Until the effective date of this module (TRK-2-14), the MDA will be implemented to generate data in the HSD format as given in TRK-2-11. The TRK-2-11 format will be provided for all projects requiring IBM 360-75 support.

B. REVISION AND CONTROL.

Revisions or changes to information herein presented may be initiated in accordance with procedures given in Section I of this document.

This is a new module

Change:

C. GENERAL INFORMATION.

This interface assumes the Ground Communications Facility (GCF) is transparent except for imposing certain constraints concerning the use of HSD lines. These constraints are:

- (1) The rate of the HSD line shall be 7200 bps
- (2) Data shall be sent in 1200 bit blocks. (1200 bit block size is current standard. Future standard may increase block size to 4800 bit blocks.)

The radio metric data will be generated at 10-per-second doppler rate and stored on a High Rate Data Record (HRDR). The requested radio metric data sample rates will be formatted into HSD blocks and transmitted to the data user and also will be stored at the DSS as an Original Data Record (ODR). Meteorological data blocks as defined in TRK-2-12 will also be transmitted from the MDA or CMFA via HSD lines (UDT F 027_g). Additional MDA configuration and mode control blocks as defined in 820-14 will also be transmitted from the MDA to NOCC via HSD lines.

D. DATA BLOCK FORMAT AND FIELDS.

1. Generalized Data Block Format.

The generalized data block format is shown in Figures TRK-2-14-1 and TRK-2-14-2. The first 120 bits of the block, called the "header", contain 12 fields as follows:

- (a) Sync code (24 bits): Always 627 627₁₆ and are used by the GCF to sync the 1200 bit block.
- (b) Source (8 bits): The source code assignments as given in Table OPS-6-6-3A of Module OPS-6-6.
- (c) Destination (8 bits): 310_g (MCCC) as destination for realtime and HRDR recall data; 267_g for ODR recall data (OPS-6-6)

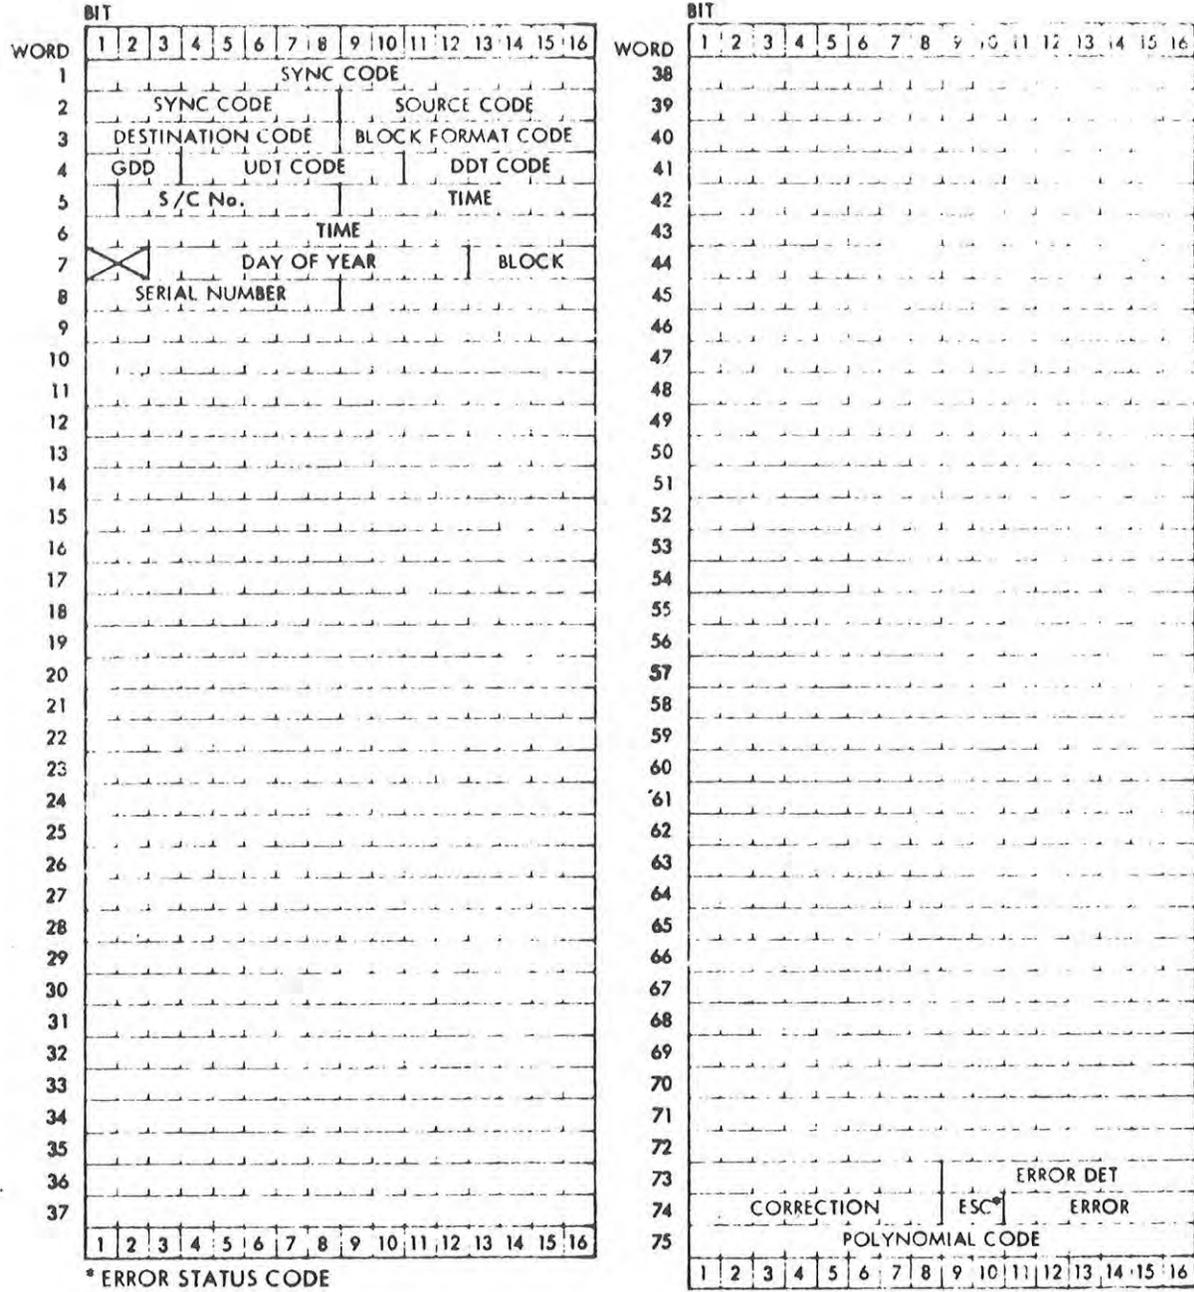

Figure TRK-2-14-1. GCF 1200-Bit High Speed Data Block
22-Bit Error Polynomial

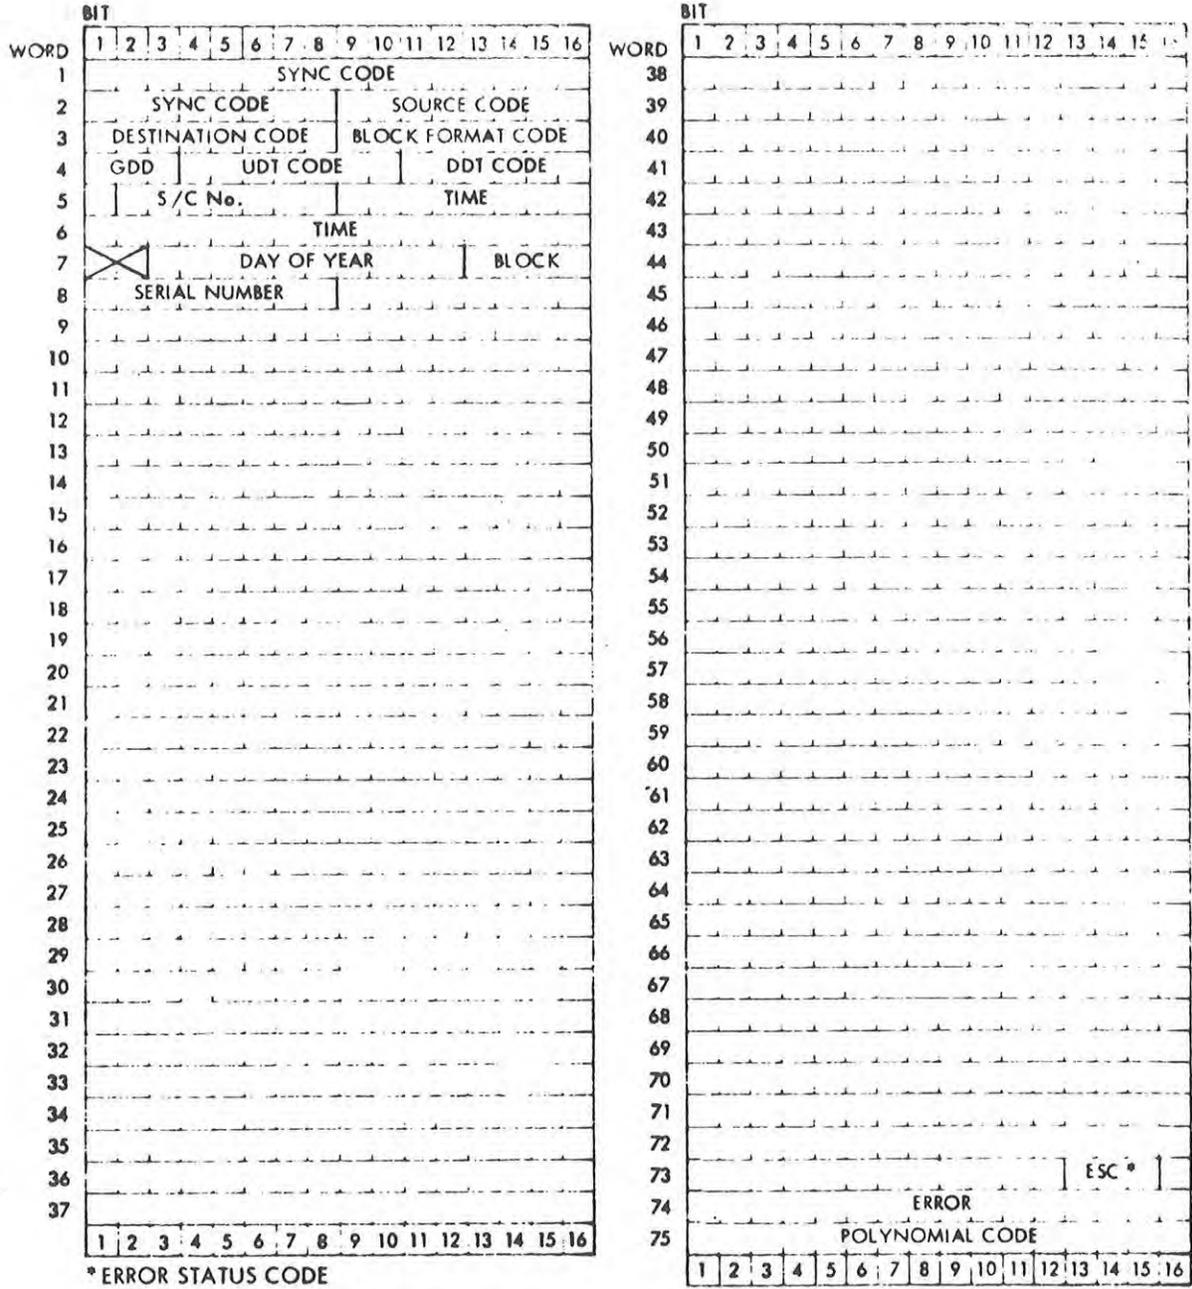

Figure TRK-2-14-2. GCF 1200-Bit High Speed Data Block
 33-Bit Error Polynomial

- (d) Block Format Code (8 bits): DE (HEX) indicating a 1200-bit HSD block with a 22-bit GCF error polynomial and 31 (HEX) for a 1200-bit HSD block with a 33-bit GCF error polynomial.
- (e) Gross Data Description (3 bits): A 000_2 will be used for real-time transmissions, 001_2 will be used to indicate ODR recall and 011_2 will be used for HRDR replay.
- (f) User Data Type (7 bits): A 026_8 is used to identify Radio Metric Data.
- (g) Data Dependent Type (7 bits): A 022_8 is used to identify the real-time or ODR recall and 130_8 is used to identify HRDR recall.
- (h) Spacecraft identification (7 bits): This is a unique number which specifies the spacecraft associated with the data in the block and is given in Table OPS-6-6-7A of Module OPS-6-6 of this document.
- (i) Time of Day (24 bits): This is given as a binary integer in units of one-hundredths of a second after 00:00:00 GMT of the current day. Time of day is the same as the time of the first data type sample in the HSD block.
- (j) Reserved (2 bits): The first two bits of Word 5 are reserved for future use. At the present time both bits are set to zero.
- (k) Day of Year (10 bits): This is given in binary coded decimal (BCD) where 1 January of a year is day one. Bits 1 and 2 = 100's of Day of Year. Bits 3-6 = 10's of Day of Year. Bits 7-10 = units of Day of Year.
- (l) Data Block Serial Number (12 bits): This binary number (modulo 4096) is incremented by one for each radio metric block transmitted. The Data Block Serial Number is unique for each User Data Type (UDT) and Source.

2. Block Information Field.

Following the HSD block header, the next 1040 bits, called the Block Information Field (BIF), contain the radio metric data. The BIF contains the following variable data types:

0-23	Not used
24-29	Reserved for system use
30	End of data for this block and this pass. (A pass may be closed out with a HSD block containing DT-30 only.)
31	End of data for this block, but not end of pass
32-36	Reserved for Radio Metric Data
37	Low rate doppler data
38	High rate doppler data
39	Angle data
40	Range data
41	DRVID data
42	Programmed oscillator frequency
43	Radio metric validation data
44-63	Reserved for additional data types

The content of data types 30, 31, 37, 38, 39, 40, 41, 42, and 43 is contained in Tables TRK-2-14-1 through TRK-2-14-8.

a. Variable Data Block (VDB) and Data Types. The variable data block is a standard 1200-bit high speed data block constructed of variable data types and filler bits. Consecutively, following the GCF header are the radio metric data types. When there is no further room to add a complete data type (Note: Data types will not be split between VDBs), a trailer data type (DT 30 or 31) will be inserted. The remainder of the data portion of the data block will be filled by filler data. The DSS will transmit radio metric data via the GCF using a UDT of 026_8 . The NOCC will transmit requests for radio metric data, binary predictions, mode and configuration to the DSS using a UDT of 021_8 .

b. Data Types and Parameter Fields. Each data type will consist of one or more parameter fields, the first of which is a 6-bit data type ID code.

Table TRK-2-14-1. End of Data Radio Metric Data

Data Type	Parameter	Bits/Parameter	LSB	Units	Comments
30	End of Data for This Block and This Pass	6	2^0	Integer	
31	End of Data for This Block, but not End of Pass	6	2^0	Integer	DT-31 sent only if greater than or equal to 6 bits available at the end of BIF

LSB = Least Significant Bit

Table TRK-2-14-2. Content of Data Type 37 (Low Rate Doppler Data) (sheet 1 of 3)

Parameter	Bits/ Parameter	LSB	Data Units	Comments	Explanatory Note (Appendix)
Data Type ID	6	2^0	-	Binary	
Doppler Frequency Band	1	-	-	0 = X-Band; 1 = S-Band	
Channel No.	3	2^0	-	Binary	1
Doppler Mode	2	-	-	00 = Coherent 3-Way; 01 = 1-Way; 10 = 2-Way; 11 = 3-Way	
GMT	17	2^0	Seconds	Binary Seconds Past "0" Hours: Always Positive	
Doppler Count	42	2^{-10}	Cycles	Modulo 2^{31} , Always Positive	2
Exciter Frequency	37	2^{-10}	Hz	Always Positive	3
Frequency Standard Reference	1	-	-	0 = Backup; 1 = Prime	4
Receiver Type	2	-	-	00 = Block III; 01 = Block IV; 11 = Spare; 10 = Blk III	5
Doppler Receiver Reference	4	2^0	-	Binary Receiver No., Always Positive; 1111 = Not Available	6
Doppler Bias	1	2^0	-	0 = -1 MHz; 1 = +1 MHz
