

# TRK-2-18

## Tracking System Interfaces

### Orbit Data File Interface

Initial Release: June 15, 1983

Change 3: June 15, 2000

## ***Section 1*** ***Introduction***

### ***1.1 Purpose and Scope***

This module specifies the Orbit Data File (ODF) format of the radio metric data from the Deep Space Network (DSN). The contents and formats of the ODF data blocks/records generated by the DSN Multimission Navigation (MMNAV) Radio Metric Data Conditioning Team (RMDCT), and either transmitted electronically or provided on magnetic tape, are herein defined.

#### ***1.1.1 Applicability of this Release***

The 'Change 3' update to this module deletes items that are not available and will not be provided. Other updates to clean-up things that do not exist or are no longer applicable.

The 'Change 2' update to this module adds missing text to clarify the calculation for frequency bias in Appendix A.

The 'Change 1' module update corrects the interface specification to be consistent with revisions approved on 15 August 1996 by the Multimission Ground Support Office (MGSO), and implemented in the Radio Metric Data Conditioning (RMDC) software. Uplink and downlink Doppler phase data have been added to the ODF since the original DSN release.

### ***1.2 Revision and Control***

Revisions or changes to information herein presented may be initiated in accordance with the procedures in Section 1 of this document.

### ***1.3 Applicable Documents***

|         |  |
|---------|--|
| 820-013 | Deep Space Network System Requirements - Detailed Subsystem Interface Design |
|---------|--|

### ***1.4 Convention***

The ODF File Label Record (Table 3-1b) specifies a 2-digit year in the File Creation Date (item number 18). This item has no application to processing any data in the file. However, it is constructed with the premise that values from 50 to 99 shall signify dates with respect to 1900, and values between 00 and 49 shall represent dates with respect 2000.

820-013  
TRK-2-18

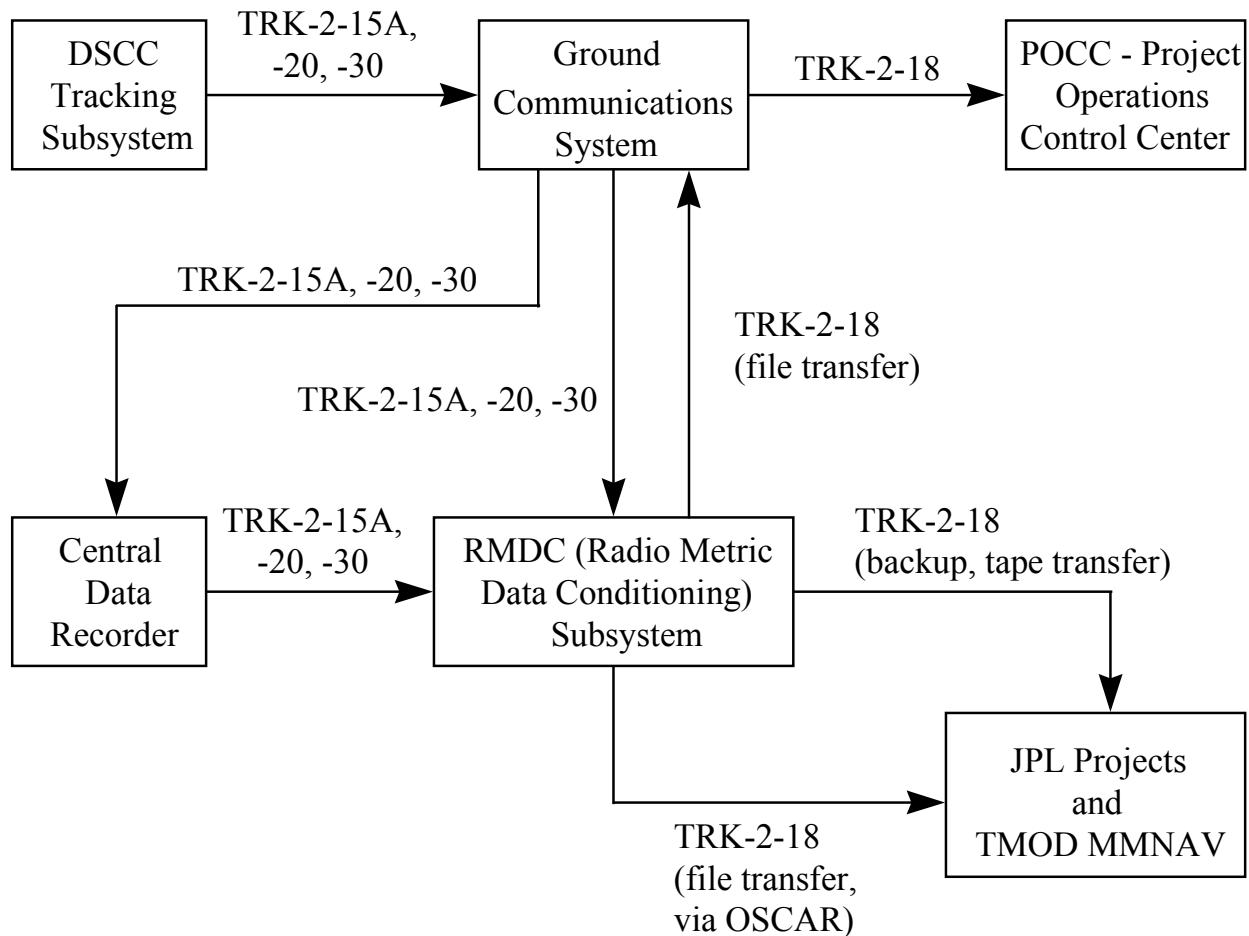

This page left intentionally blank

## ***Section 2*** ***General Information***

The data will be stored by the RMDCT for transmission.

Figure 2-1 shows the data flow from the DSN Signal Processing Center (SPC) to the Project Operations Control Center (POCC) for the transmitted data, and for data provided electronically or on magnetic tape to JPL Projects.

When the ODFs are to be transmitted to a POCC, the Ground Communications Facility (GCF) is assumed to be transparent. The data shall be formatted into 1200-bit or 4800-bit data blocks and transmitted to the user via the Digital Communications Subsystem (GDC) of the GCF.

**Figure 2-1. Data Flow for Orbit Data File Interface**

## ***Section 3***

### ***Data Format and Fields***

#### ***3.1 GCF Data Blocks***

The ODF data blocks are standard 1200-bit or 4800-bit data blocks which contain radio metric data that have been generated from the 820-13, TRK-2-15A, TRK-2-20, and TRK-2-30 formats. The first 120 bits of the block form the block header and provide information common to all data in the block. The Block Information Field (BIF) consists of 1032 bits for a 1200-bit block and contains three packets (each consisting of nine 32-bit words) described in Tables 3-1 through 3-8. The BIF for 4800-bit blocks consists of 4632 bits and contains 16 packets of data. The last 48 bits of the data block contain the GCF error detection and correction data, the Error Status Code (ESC), and the Error Polynomial Code (EPC). The ODF data blocks will be ordered by block header time and date. Detailed descriptions of the header, BIF, and block ending are provided in the following paragraphs:

#### WORD 1 THRU WORD 8, BIT 8

Standard DSN Block Header as described in module OPS-6-8 of this document, with the following code assignments:

Source Code =  $AF_{16}$  ( $257_8$  = DSN MMNAV)

UDT Code =  $15_{16}$  ( $025_8$ )

DDT Code =  $14_{16}$  ( $024_8$ )

#### WORD 8, BITS 9 THRU 16

Set to zeros

#### WORD 9 THRU WORD 72/WORD 297

BIF - ODF data with the following constraints:

- (1) Each complete ODF will span several blocks.
- (2) A complete ODF will consist of the following data presented in order of transmission:
  - a) File Label group - one per ODF (Tables 3-1a and 3-1b); required
  - b) Identifier group - one per ODF (Tables 3-2a and 3-2b); required
  - c) Orbit Data group - multiple records, time ordered (Tables 3-3a and 3-3b); required
  - d) Ramp groups - one group for each DSS, multiple records, time ordered (Tables 3-4a and 3-4b); optional

- e) Clock Offsets group - multiple records, time ordered (Tables 3-5a and 3-5b); optional
  - f) (Note. Tables 3-6a and 3-6b have been deleted.)
  - g) Data Summary group - multiple records, ordered by station, band, and data type (Tables 3-7a and 3-7b); optional
  - h) End-of-File group - one per ODF (Table 3-8); required
- (3) Each ODF consists of the radio metric data for one spacecraft, zero or more quasars, and one or more stations.
  - (4) Character data are 8-bit, ASCII-equivalent integer values.
  - (5) Times, except as noted, are given as seconds past zero hours UTC of January 1, 1950.
  - (6) For 1200-bit blocks, Words 63 through 72 always consist of filler bits (repetitive 1000). For 4800-bit blocks, Word 297 will always be filler. Unused portions of any BIF will be filler.
  - (7) The ODF data words are 32 bits in length.
  - (8) The 5th and 6th data words of an ODF packet/record are always zero (0) for a group header record, and are always non-zero for a data record.
  - (9) The parameter field pack format conventions used herein are as follows:
    - I<sub>x</sub> = unsigned integer, x bits in length
    - S<sub>x</sub> = signed integer, x bits in length, two's complement
  - (10) Most data parameters will be provided as binary integers; two's complement will be used for all fields that may have negative values.
  - (11) Single-bit status parameters will be set to one (1) for no, bad, off, out of tolerance, etc.; and will be set to zero (0) for yes, good, on, in tolerance, etc.

WORD 73 THRU WORD 75/WORD 298 THRU WORD 300

Standard DSN block ending as described in module OPS-6-8 of this document.

### ***3.2 Electronic and Magnetic Tape Interfaces***

The ODF data are provided in disk files or on unlabeled, 9-track, 1600-bits/inch magnetic tapes. Each ODF block (or physical record) consists of 2016 32-bit words, for a total length of 64512 bits. Each ODF block contains 224 9-word (288-bit) logical records. These records are described in Tables 3-1 through 3-8.

**Table 3-1a. ODF File Label Group Header Format**

| Item Number | Pack Format | Data Word | Description                            |
|-------------|-------------|-----------|--|
| 1           | S32         | 1         | Primary Key = 101                      |
| 2           | I32         | 2         | Secondary Key = 0                      |
| 3           | I32         | 3         | Logical Record Length (in packets) = 1 |
| 4           | I32         | 4         | Group Start Packet Number (= 0)        |
| 5-9         | 5*I32       | 5-9       | 0                                      |

**Table 3-1b. ODF File Label Group Data Format**

| Item Number | Pack Format | Data Word | Description  |
|-------------|-------------|-----------|--|
| 1-8         | 8*I8        | 1-2       | System ID - 8 ASCII "Characters" (e.g., "AXP2300 ")  |
| 9-16        | 8*I8        | 3-4       | Program ID - 8 ASCII "Characters" (e.g., "ODE V2.0") |
| 17          | I32         | 5         | Spacecraft ID Number                                 |
| 18          | I32         | 6         | File Creation Date (YYMMDD)                          |
| 19          | I32         | 7         | File Creation Time (hhmmss)                          |
| 20          | I32         | 8         | File Reference Date (YYYYMMDD)*                      |
| 21          | I32         | 9         | File Reference Time (HHMMSS)*                        |

\* Currently the ODF data timetags are referenced to EME50. Hence, these two items are set to 19500101 (date) and 000000 (time) respectively. Older ODFs which have file reference date and time both equal to zero will be assumed to be EME50.

**Table 3-2a. ODF Identifier Group Header Format**

| Item Number | Pack Format | Data Word | Description                            |
|-------------|-------------|-----------|--|
| 1           | S32         | 1         | Primary Key = 107                      |
| 2           | I32         | 2         | Secondary Key = 0                      |
| 3           | I32         | 3         | Logical Record Length (in packets) = 1 |
| 4           | I32         | 4         | Group Start Packet Number (= 2)        |
| 5-9         | 5* I32      | 5-9       | 0                                      |

**Table 3-2b. ODF Identifier Group Data Format**

| Item Number | Pack Format | Data Word | Description                                    |
|-------------|-------------|-----------|--|
| 1-8         | 8*I8        | 1-2       | "TIMETAG" - 8 ASCII "Characters"               |
| 9-16        | 8*I8        | 3-4       | "OBSRVBL" - 8 ASCII "Characters"               |

- \* Units are specified by item 10 (Data Type ID)
- \*\* Actually I46, but may be split as necessary for specific computers
- \*\*\* Transponder frequency if 1-way Doppler or phase; 0 (zero) if NSP (Network ID = 3) and not 1-way; receiver frequency if ramped and not 1-way; transmitter frequency otherwise.

## *Appendix A*

### A.1. *Doppler and Range Observables*

Doppler and range observables, rather than the actual measurements made at the Deep Space Stations are provided in the ODF Orbit Data Group (see Table 3b, items 4 and 5).

The Doppler observable (in Hertz) is computed according to the following equation. The time tag is at the mid-point of the compression interval,  $t_i$  to  $t_j$ .

$$\text{Observable} = (B / |B|) * [(N_j - N_i) / (t_j - t_i) - |F_b * K + B| ]$$

where:

- B = Bias placed on receiver
- $N_i$  = Doppler count at time  $t_i$
- $N_j$  = Doppler count at time  $t_j$
- $t_i$  = start time of interval
- $t_j$  = end time of interval
- $F_b$  = frequency bias
- K = 1 for S-band receivers (Table 3b, Item 11)
- = 11/3 for X-band receivers
- = 176/27 for Ku-band receivers
- = 209/15 for Ka-band receivers

NOTE: Future spacecraft transponders may require different turnaround ratios (e.g., the value of K may vary)

$$F_b = (X_1 / X_2) * (X_3 * F_r + X_4) - F_{sc} + R_3 \quad \text{for 1-way Doppler}$$

$$F_b = (X_1 / X_2) * (X_3 * F_r + X_4) - (T_1 / T_2) * (T_3 * F_t + T_4) \quad \text{for all other Doppler}$$

where:

$F_r$  = Receiver (VCO) frequency at time  $t_r$

$F_{sc}$  = Spacecraft (beacon) frequency

$F_t$  = Transmitter frequency at time  $t_{r-RTL}$

- $R_3 = 0$  for S-band receivers
- = 0 for X-band receivers
- = 0 for Ku-band receivers
- = 0 for Ka-band receivers

- $T_1 = 240$  for S-band transmitters (Table 3b, Item 12)
- = 240 for X-band transmitters
- = 142 for Ku-band transmitters
- = 14 for Ka-band transmitters

$T_2 = 221$  for S-band transmitters  
= 749 for X-band transmitters  
= 153 for Ku-band transmitters  
= 15 for Ka-band transmitters

$T_3 = 96$  for S-band transmitters  
= 32 for X-band transmitters  
= 1000 for Ku-band transmitters  
= 1000 for Ka-band transmitters

$T_4 = 0$  for S-band transmitters  
= 6,500,000,000 for X-band transmitters  
= -7,000,000,000 for Ku-band transmitters  
= 10,000,000,000 for Ka-band transmitters

$X_1$  to  $X_4$  have the same values as  $T_1$  to  $T_4$  but are dependent on the exciter band (Table 3b, Item 13) at the receiving station.

NOTE: When the reference frequency (Table 3b, items 18 and 19) is provided at sky level,  $T_3$  and  $X_3$  are 1 for all bands, and  $T_4$  and  $X_4$  are 0 for all bands.

For range data, the observable is computed as follows:

$$\text{Observable} = R - C + Z - S$$

where:

R = range measurement  
C = station delay calibration  
Z = Z-height correction  
S = spacecraft delay
